IV-eye FAQs

Q: How much training will my staff require?

A: The IV-eye is designed for simple ease of use, with a single button operation and no calibration required, so both initial and ongoing training is minimal.

Q: Will I need a stand or another colleague to hold the device?

A: No, the IV-eye is truly handheld. It is small, lightweight (185g) and very portable. Operating on 2 x AA batteries, it can be used wherever and whenever you need it.

Q: Will I need to dim the lights to get a good image?

A: The IV-eye's display works in bright daylight and at night-time, showing veins up to a depth of 10mm through all pigmented skin types.

Q: Can the IV-eye help me differentiate deeper lying vessels and deal with hair interference?

A: The IV-eye has two color modes. The grayscale mode clearly distinguishes between those vessels that are close to the surface and those which are deeper lying. The color mode reduces hair interference and offers higher contrast and definition of vessels.

Q: Is the device suitable for use anywhere?

A: Yes, the IV-eye is designed to withstand frequent use in or out of a hospital environment and comes with a 2-year manufacturer warranty as standard.

Why should I use vein visualization technology?

The Infusion Nursing Standards of Practice (2016), issued by the Infusion Nurses Society (INS), recommend: *“Visualization technology is used in patients with difficult venous access and/or after failed venipuncture attempts.”*

How does vein visualisation technology help to improve outcomes?

Why use the IV-eye vein finder?

“The IV-eye has given confidence to my nursing staff and has led to a higher first attempt success rate for IV starts. Being able to see the vein and potential bifurcations helps our nurses to choose the most ideal vein sooner, and has led to a higher satisfaction rate for the patients we serve. Easily became a staple for our home infusion nursing team!”

Gina Livingston, RN, BSN, DON
